Introduction

The data presented in this report tracks energy consumption following the introduction of energy saving technologies and behaviours.

The report describes works undertaken in each property. Alongside this, there are graphs and tables demonstrating the reduction in electric, gas and water consumption.

Gas

The gas used has been adjusted by degree day data. This is to allow a fair comparison of the gas used from different periods with different weather conditions. It allows the energy consumption figures to be adjusted to factor out variations in outside air temperature.

The graph below shows that the base year of 2011 was relatively mild during the spring, autumn and winter months.

Colder outside temperatures during other periods mean that more gas was needed to heat the spaces to the same ambient temperatures. To enable a like for like analysis to be undertaken, gas consumption has been degree day adjusted. The colder weather makes like for like comparisons impossible without the degree day adjustment.

<u>Guildhall</u>

<u>Electric</u>

In 2012, 324 50watt halogen spot lights were replaced by 5watt LED spotlights.

The areas concerned were the Guildhall corridors, the lobby's, the Walton Room and Walton Room stairwell, the Wintonian Room, the old Courtyard Café, reception and eighteen71 Café.

Low wattage LED lights were also specified and installed when undertaking the Artists Room refurbishment in 2013 and the ground floor male and female toilets in 2014. The upgrade in the toilets delivered a 30% energy saving.

Electricity use was further reduced by encouraging Guildhall staff to switch off lights and equipment when rooms were not in use. Most notable savings were from switching off the Air Handling Units for the Bapsy Hall and Conference Chamber.

Furthermore, in 2013 the Fan Coil Units which supplied heat to the King Charles Hall were upgraded. The new heaters were installed with high efficiency fan motors which typically save between 29 - 81% (depending on mode) when compared to standard motors.

The changes have led to a reduction in electricity consumption as follows:

- 2012/2013 vs 2011/2012 saw a decrease in consumption of 9%. Carbon saving: 29.13 tons
- 2013/2014 vs 2012/2013 saw a further reduction of 14%. Carbon saving: 23.06 tons
- 2014/2015 vs 2013/2014 has to date seen an increase of 2.12%, due to an increase in business of 5%. Carbon increase: 1.95 tons

City Offices

<u>Electric</u>

Electricity consumption has reduced steadily since 2012 as demonstrated by the graph below. The introduction of sixteen new gas boiler fed radiators throughout City Offices in 2012 and a further two in late 2013 has made for a reduced reliance on electric heaters.

The reduction in electricity consumption at City Offices was also attributable to I.T. server being moved from City Offices to West Wing. The move began in November 2012.

This has resulted in an improving trend in the reduction of electric consumption:

- 2012/2013 vs 2011/2012 saw a decrease in consumption of 3.81%. Carbon saving: 10.23 tons
- 2013/2014 vs 2012/2013 saw a reduction of 11.99%. Carbon saving: 18.44 tons
- 2014/2015 vs 2013/2014 has to date seen a reduction of 18.88%. Carbon saving: 15.96 tons

West Wing Offices

<u>Electric</u>

The temperature of the air conditioning in West Wing was increased to 24c in July 2012. Previously the office temperature had been set between 19 - 21c.

In November 2012 I.T. server equipment started to be migrated from City Offices to West Wing. This has accounted for a substantial increase in electricity consumption.

The graph below shows the increase in consumption in West Wing compared to the previous base year as more I.T hardware migrated to West Wing from City Offices.

The graph also shows decreased consumption as I.T. hardware is moved out of City Offices.

What can be seen is that the increased consumption in West Wing is not equalled by the reduction in consumption in City Offices until July 2014.

In July 2014 a new air conditioner was installed in the West Wing server room. The new air conditioner is specifically designed for locations such as server rooms because it offers 'sensible cooling'. This means that the air conditioner concentrates on reducing the temperature of the air, rather than also trying to reduce the moisture content of the air as well. The new modern unit is also more energy efficient because it has an inverter compressor. An external variable frequency drive varies the speed of the compressor motor to modulate cooling output.

The graph shows that from July 2014 energy savings in City Offices out weighed the energy increases in West Wing.

The graph below demonstrates the increase in consumption in West Wing. The positive effect of the new air conditioner can be seen from July 2014

- 2012/2013 vs 2011/2012 saw an increase in consumption of 16% as the I.T. server equipment began to migrate from City Offices to West Wing. Carbon increase: 8.71 tons
- 2013/2014 vs 2012/2013 saw a further increase of 67%. Carbon increase: 41.16 tons
- 2014/2015 vs 2013/2014 has to date seen a reduction of 5.57%. Carbon saving: 3.31 tons

City Museum

Electric

In April 2014 all of the 50w halogen spotlights in the City Museum were upgraded to 5w LED spotlights. This involved new track lighting throughout and new fittings in particular displays. Furthermore, an additional 12 fittings were installed to brighten particularly dull areas. A total of 86 new LED fittings were installed.

The reduction in consumption can be seen in the graph below

- 2013/2014 vs 2012/2013, saw a reduction in consumption of 1.89%. Carbon Saving: 0.18 tons
- 2014/2015 vs 2013/2014 has to date seen a reduction of 25.40%. Carbon saving: 1.3 tons

Chesil Multi Storey Car Park

<u>Electric</u>

In August 2014 work began to upgrade 271 fluorescent lights throughout the parking levels in Chesil Multi Storey Car Park.

Following the trial of low energy lighting in Chesil Street Multi Storey Car Park the chosen fittings were made by a company called Trilux and were the most suitable of all seven low energy lighting options considered because of their light output. They also offered the greatest life expectancy and best value for money.

Furthermore, the chosen LED fittings provided energy and maintenance savings. Each old fluorescent light fitting in the car park used 116w (parking bays) and 58w (ramps). Each of the new LED fittings use 60w (parking bays) and 45w (ramps).

- 2013/2014 vs 2012/2013, saw an increase in consumption of 1%. Carbon increase:
 0.59 tons
- 2014/2015 vs 2013/2014 has to date seen a reduction of 8%. Carbon saving: 3.99 tons
 - September 2014 vs September 2013 has seen a reduction of 24%.
 - o Further energy savings will be possible following the installation of passive infrared sensors (PIR) on the outside row of lights on floors 5 − 8. Currently the PIR technology is being tested on floor 5.

<u>Guildhall</u>

<u>Gas</u>

Boiler House Improvements

There have been a number of actions that have contributed toward the reduction in gas consumption at the Guildhall.

The first action was to install bespoke insulation jackets designed to dramatically reduce heat loss from exposed flanges and valves to therefore, save gas. These were installed in late February 2012.

Building Fabric Improvements

The thermal performance of the Guildhall has been improved. The windows were upgraded October 2012. A unique gasket sealing system was chosen to draught proof many of the windows and doors in the Guildhall.

The areas draught proofed were; the, Wintonian Room, Bapsy Hall, Print Room, Solutions Office, Estates Office, the Carpenter Turner Suite, Kingsgate Room and Eversley Room.

By reducing the amount of heat that escapes and reducing the movement of cold air it was been possible to save energy through quicker warm up times and heat retention. It has enabled thermostats to be turned down, weather compensation curves to be adjusted and has improved the comfort levels of staff and visitors.

The first floor main entrance draught lobby was also made operational by fixing the inner doors and installing draught proofing. Additionally, insulation above the Mayors Parlour (2012) and King Charles Hall (2013) was installed.

- 2011/2012 vs 2010/2011, August 2011 onwards, saw a decrease in consumption of 20.40%. Carbon saving: 12.24 tons
- 2012/2013 vs 2011/2012 saw a decrease in consumption of 5.37%. Carbon saving: 2.86 tons
- 2013/2014 vs 2012/2013 saw a reduction of 2.38%. Carbon saving: 1.19 tons
- 2014/2015 vs 2013/2014 has to date seen an increase of 8.06%. Carbon increase: 0.63 tons

Although consumption has risen in the last year, the Guildhall has also seen an increase in business. The increase in business in this financial year has been 5%.

City Offices

<u>Gas</u>

Boiler House Improvements

Bespoke insulation jackets designed to reduce heat loss from exposed flanges and valves in City Offices were installed in February 2012.

The graph below highlights that the jackets continued to aid gas consumption reduction. However, it can also be seen that consumption began to increase from November 2012 onwards.

The increase in November 2012 was due to the colder weather boosting demand for heat in the building and the continued breakdown of the way in which the City Offices heating system distributed heat throughout the building. During November 2012, the Facilities Team received complaints from members of staff in City Offices that they were cold. Inspection of the system identified that there were many areas throughout the building where no heat was being delivered. To combat this in the short term, the internal temperature of the building was increased.

During November and December 2012 sixteen, 2.5 kW radiators were introduced throughout City Offices into areas where there was no heat being previously distributed. This meant gas consumption increased.

Following the installation of the additional radiators the boiler optimisation controls have been monitored closely. This has resulted in an improving trend in the reduction of gas consumption:

- 2011/2012 vs 2010/2011, August 2011 onwards, saw a decrease in consumption of 17.14%. Carbon saving: 5.72 tons
- 2012/2013 vs 2011/2012 saw an increase in consumption of 21.21%. Carbon increase: 6.32 tons
- 2013/2014 vs 2012/2013 saw a decrease in consumption of 10.04%. Carbon saving: 3.60 tons
- 2014/2015 vs 2013/2014 has to date seen a decrease of 46.93%. Carbon saving: 1.51 tons

<u>City Offices – Annex</u>

<u>Gas</u>

In October 2013 a new Worcester Greenstar condensing boiler was installed in the Annex along with a new 7 day programmer to provide increased boiler efficiency and improved control.

The new boiler was selected from a list of products endorsed by the Energy Saving Trust.

- 2013/2014 vs 2012/2013, saw a decrease in consumption of 33.72%. Caron saving: 1.65 tons
- 2014/2015 vs 2013/2014 has to date seen a decrease of 33.85%. Carbon saving: 0.21 tons

West Wing Offices

<u>Gas</u>

Boiler Room & Heating Improvements

Bespoke insulation jackets designed to reduce heat loss from exposed flanges and valves in West Wing were installed in late February 2012.

In February 2013 a project to install new boiler controls, weather compensation, monitoring software, new pumps, new hot water cylinder, variable speed pumps and pipe insulation throughout the building was completed.

It has meant that gas consumption has improved steadily since April 2013.

- 2012/2013 vs 2011/2012 saw an increase in consumption of 26.98%. Carbon increase: 5.97 tons
- 2013/2014 vs 2012/2013 saw a reduction of 49.76%. Carbon saving: 9.52 tons
- 2014/2015 vs 2013/2014 has to date seen an increase of 31.19%. Carbon increase: 0.75 tons. The reason for this increase is because no gas was used during the summer months in 2013. However, a relatively small amount of gas was used during the summer months of 2014. This was because the boiler controls were in 'auto' mode throughout 2014. This meant that on occasion the boiler control system calculated that it would use gas to provide heat to the taps rather use the electric immersion heater.

Abbey House

<u>Gas</u>

Insulation Works

In May 2012 the fibre boards lining the loft space were removed and gang ways installed so that all areas of the roof could be insulated with 300mm of rock wool, which was laid over the ceiling joists. The insulation was estimated to reduce gas consumption by 19% a year. Boiler timers were also been adjusted in December 2012 to save 2.5 hours of energy each day.

In January 2014 timber windows and external doors at Abbey House were renovated and draught proofed. Substantial repairs to rotten wood work and ill fitting casements was undertaken to improve the historic fabric of the building. It was proposed that the works would allow for a modest energy saving, as much as 10%.

The graph below demonstrates that there does not appear to be a consistent pattern of reduction throughout the winter months to date.

- 2012/2013 vs 2011/2012 saw an increase in consumption of 14.46%. Carbon increase: 1.70 tons.

- 2013/2014 vs 2012/2013 saw an increase of 5.10%. Carbon increase: 0.68 tons.

- 2014/2015 vs 2013/2014 has to date seen a reduction of 21.10%. Carbon saving: 0.58 tons

The variable consumption is due to the lack of centralised control over the system and a problem with heat distribution to one room. The lack of a control programmer means that the heating runs for seven days a week, even if no one is in the building. Furthermore, internal temperatures were boosted by local adjustment of the controls by users of the building.

CAB2655 - APPENDIX A

It is therefore proposed to install a more sophisticated control system to marry the supply of heating to the times the heating is required to help achieve the anticipated savings from the insulation and draught proofing. The new heating controller will be weather compensated which will enable the heating to react to colder and warmer periods accordingly. Weather compensation will also allow the boiler to condense during autumn and spring.

Consideration is being given to installing a similar controller to that of the West Wing offices and the Guildhall. This will the allow for the installation of software which will enable monitoring from a computer of all three sites which will in turn produce further energy savings because set points can be adjusted remotely. Such savings have been achieved through this method in the West Wing.

In the short term it is proposed to install limit stops on wall stats which will prevent house occupants boosting and leaving temperatures excessively high whilst the building is unoccupied.

<u>Guildhall</u>

<u>Water</u>

In August 2012 water displacement bags were installed in every toilet cistern following a successful trial in the West Wing Offices. However, blockages began to occur in the ladies toilets which meant that the bags were removed from the ladies cisterns in mid October 2012. The 'save a flush' bags saved one litre of water every time a toilet is flushed.

A further water saving product was also trialled and then rolled out to the Guildhall in late October 2012. By using 'Bio Balls', a biological block that contains billions of friendly bacteria and locating it in each urinal, the male urinals were made waterless.

However, by July 2013, it was decided to remove the bio ball due to concern over unpleasant smells.

In April 2014 works to refurbish the ground floor toilets began. As part of this project 8 new water efficient toilets were installed in the ladies toilets. The new toilets reduce water consumption by 81%.

- August 2012 August 2013 saw a decrease in consumption of 20% when compared to the same period in 2011.
- August 2013 August 2014 however, saw an increase of 32% due to the removal of the waterless urinal product and a water leak.
- August 2014 has to date seen a reduction of 51% when compared to the same period in 2013.

City Offices

<u>Water</u>

In July 2012 water displacement bags were installed in every toilet cistern. However, later problems with blockages in the ladies toilets meant that the bags were removed from the ladies toilets in mid October 2012. The 'save a flush' bags save one litre of water every time a toilet is flushed.

A further water saving product was trialled in the West Wing Offices in mid July and subsequently rolled out to the Guildhall and City Offices in late October 2012. By using 'Bio Balls', a biological block that contains billions of friendly bacteria and locating it in each urinal, the male urinals were made waterless. However, after one year in situ, it was decided to remove the bio ball due to the growing number of staff complaints regarding unpleasant smells.

Nonetheless, water consumption has been significantly reduced and kept low by the installation of flow restrictors on the taps in each toilet. The flow restrictors reduce the water flow from 15 litres per minute to 3 litres per minute.

Water consumption at City Offices, when compared to the base period has reduced by 42%

The graph below demonstrates the reduction in water consumption.

West Wing Offices

<u>Water</u>

The Bio Ball was first trialled in the West Wing Offices in late July 2012. The Bio Ball has been particularly effective in the West Wing Offices because there was previously no control on how frequently the urinals flushed. Coupled with the introduction of the water displacement bags to the toilet cisterns, the graph and table below demonstrate how successful the Bio Ball has been in saving water.

Administration Savings

Financial savings have been achieved by scrutinising energy bills:

- Incorrect admin charges £1231.98
- Incorrect Climate Change Levy Charges £5834
- Incorrect charges on faulty gas meter, 5-6 The Square £2082
- Duplicate water charges, Tower Street Public Convenience £241

Guildhall Carbon Smart Accreditation

In 2012 the Guildhall enrolled in an accreditation scheme called Carbon Smart.

The scheme recognises the efforts of businesses in their efforts to reduce their carbon impact. In late 2013, the Guildhall gained the second highest accreditation; silver.

Future Projects

Brooks Centre Underground Car Park

Following a feasibility study undertaken by Hudson Dick Associates; a Mechanical and Electrical Consultancy firm, it was established that the Air Handling Unit (AHU) in the underground Brooks Centre car park could be updated to save money and reduce carbon emissions.

The AHU was designed to supply fresh air to the car park as well as extracting car fumes. The AHU runs continuously for 69 hours per week, to closely mirror the opening times of the Brooks Shopping Centre.

The feasibility study identified that the AHU could be linked to Carbon Monoxide sensors that would vary the speed of the AHU fans, thus saving significant energy and money. The proposal stated that the fans would always operate at 20% of their full capability resulting in a 90% energy saving. If the Carbon Monoxide sensors identified that the fan speed should be increased to sustain air quality, the inverters linked to the fans would slowly increase their speed. The feasibility study identified that electric consumption would be cut by at least 60% saving an estimated £20,000 per annum. This equates to a carbon saving of 47.84 tons per annum.

Abbey Mill Hydro Electric Water Turbine

A feasibility study to install a 9.9 kW Crossflow turbine identified that the Council could generate 70,873 kW per annum, equating to £20,000 per annum.

A Pre Application for the scheme has been submitted to the Environment Agency and has received an initial reply.

In order for the project to be viable additional water flow needs to be directed toward Abbey Mill. Winchester City Council would need to satisfy the Environment Agency and Natural England that this will not be of detriment to the ecology of the main Itchen SAC and will not pose a flood risk.

Car Park Lighting

Chesil Multi Storey - Upgrade remaining stairwell, toilet and external lights with new LED fittings.

Tower Street Multi Storey – Upgrade 399 fluorescent lights throughout parking levels and additional stairwell lights with new LED fittings.

Abbey House Heating

Options for a more sophisticated heating control system are under consideration. The new heating controller will be weather compensated which will enable the heating to react to colder and warmer periods accordingly. Weather compensation will also allow the boiler to condense during autumn and spring.

As part of this project, consideration is also being given to installing a similar controller to that of the West Wing offices and the Guildhall. This will the allow for the installation of software which will enable monitoring from a computer of all three sites which will in turn produce further energy savings because set points can be adjusted remotely. Such savings have been achieved through this method in the West Wing.

In the short term it is proposed to install limit stops on wall stats which will prevent house occupants boosting and leaving temperatures excessively high whilst the building is unoccupied.

Guildhall Heating

Undertake works to enable heating system pumps to operate at times of demand only and in variable speed mode.

Voltage Optimisation

An initial proposal from Power Perfector has identified that there could be an opportunity to save 26,921 kWh per annum, a carbon saving of 13.19 tons per annum from voltage optimisation in the West Wing offices. Further investigation is required to establish an accurate level of potential savings.

<u>Water</u>

Undertake survey to establish a business case for installing water efficient Propelair toilets in the second floor toilets of the Guildhall and in the West Wing offices.

Install purpose built waterless urinals developed by Ecoprod in the West Wing offices.

Install flow restrictors on the taps in the Guildhall ground floor public conveniences.

West Wing Offices – Lighting

Investigate opportunity for upgrading the lighting throughout West Wing offices to LED.

<u>CAB2655 – APPENDIX B</u>

Not issued as no longer required.

Guildhall Financial Performance Review Appendix C

Period: January 2015

The data used to display the current financial performance has been taken from the ledger in a bid to demonstrate income against expenditure. Both the expenditure & income budgets have now been profiled in an effort to show budgets in line with the expected / forecasted business.

The profiled budgets are still awaiting approval prior to passing to finance for inclusion into the accounts.

The above (accumulated) graph collates all the 34^{**} Guildhall budget codes across the business area to show planned and actual expenditure, the planned and actual income achieved to the given period. Projection lines have been added as an indication to help show the approximate income and expenditure position at yearend based on the recorded expenditure and incomes to date.

Based on the current figures and having started the year with a realistic budget if we continue to achieve expenditure control and income, we are potentially set to be in a more favourable position by year end.

Room Hire

The accumulated room hire to date is still achieving more than in the previous year and is currently at 7% above last year on the year to date figure.

Equipment Hire

Equipment hires still remains ahead of the previous year by 21%

Bar Services

Bar services cover all fixed bars, temporary bars, wine tables and banqueting events etc. currently income year to date this is 2% below the plan and expenditure is 11% above the plan.

Bar Services Year on Year

The graph shows current performance against that achieved in the previous financial year and we are 3% down on last year at this time.

Food & Beverage Service

The following view shows the performance of the café counter sales through eighteen71 along with the planned budgets. The actual expenditure YTD has exceeded the planned expenditure 15% however the income has achieved 18% above the plan YTD.

Counter Sales comparison year on year, currently showing 19% increase over last year

Conference Catering

The following graphs show the catering delivered to both our external and internal clients and includes any banqueting service that may have been provided by the F&B team. Internal conferences show a decrease (2%) however external conferences are currently showing a 6% increase over the previous year to date.

Comparison sales position year on year is showing a 12% increase over last year on food sales when combined with café and conference sales

Section added below is a view of the café best-selling items over the last full month

eighteen71 Top Ten Sellers in the Last Month
